Optimized Algorithms Reduce Active Processing. According to one of Nestwave's blog posts on signal processing, received signals are processed using symmetrical matched filters (MF) in conventional systems. MF processes multipath components as part of the received signal, but for time-of-arrival estimation, multipath elements must be eliminated.

One of the major challenges of modern military Digital Signal Processing (DSP) is dealing with the ever-widening bandwidth of digitized signals. Until fairly recently, analog-to-digital converters (A/D converters) were limited to only hundreds of MHz, so anything beyond that had to be dealt with using traditional RF/analog methodologies. Now that A/D converters are available in the GHz range ...
